Legal Notes

Special Export Regulations!

Cameras with thermal image sensors ("thermal cameras") are subject to the special export regulations of the U.S.A. and including the ITAR (International Traffic in Arms Regulation):

- According to the currently applicable export regulations of the U.S.A. and the ITAR, cameras with thermal image sensors or parts thereof must not be exported to countries embargoed by the U.S.A., except if a special permit can be presented. At present, this applies to the following countries: Crimea region of Ukraine, Cuba, Iran, North Korea, Sudan, and Syria. The same export ban applies to all persons and institutions listed in "The Denied Persons List" (see www.bis.doc.gov, "Policy Guidance > Lists of Parties of Concern"; https://www.treasury.gov/resource-center/sanctions/sdn-list/pages/default.aspx).
- Under no circumstances must the camera itself or its thermal image sensors be used in the design, the development or in the production of nuclear, biological or chemical weapons or in the weapons themselves.

Legal Aspects of Video and Sound Recording

You must comply with all data protection regulations for video and sound monitoring when using MOBOTIX AG products. Depending on national laws and the installation location of the FF Group LPR App – Region EUCA, the recording of video and sound data may be subject to special documentation or it may be prohibited. All users of MOBOTIX products are therefore required to familiarize themselves with all applicable regulations and to comply with these laws. MOBOTIX AG is not liable for any illegal use of its products.

Declaration of Conformity

The products of MOBOTIX AG are certified according to the applicable regulations of the EC and other countries. You can find the declarations of conformity for the products of MOBOTIX AG on www.mobotix.com under Support > Download Center > Certificates & Declarations of Conformity.

RoHS Declaration

The products of MOBOTIX AG are in full compliance with European Unions Restrictions of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment (RoHS Directive 2011/65/EC) as far as they are subject to these regulations (for the RoHS Declaration of MOBOTIX, please see www.mobotix.com, Support > Download Center > Documentation > Brochures & Guides > Certificates).

Disposal

Electrical and electronic products contain many valuable materials. For this reason, we recommend that you dispose of MOBOTIX products at the end of their service life in accordance with all legal requirements and regulations (or deposit these products at a municipal collection center). MOBOTIX products must not be

disposed of in household waste! If the product contains a battery, please dispose of the battery separately (the corresponding product manuals contain specific directions if the product contains a battery).

Disclaimer

MOBOTIX AG does not assume any responsibility for damages, which are the result of improper use or failure to comply to the manuals or the applicable rules and regulations. Our General Terms and Conditions apply. You can download the current version of the **General Terms and Conditions** from our website at www.mobotix.com by clicking on the corresponding link at the bottom of every page.

About FF Group LPR App – Region EUCA

Certified App for License Plate Recognition

The app's artificial intelligence-based algorithms, which have already been successfully tested in numerous European markets, allow the reliable recognition of single and two-line license plates of vehicles in the supported regions of origin (Latin and Hebrew characters and numbers). The app can be tested free of charge for 30 days and is activated by license for an unlimited period of time. Typical application areas for the app are: Parking management, access control and regulation, traffic monitoring.

- App delivers events via MxMessageSystem in real-time
- Integrated recognition protocol (last 1000 recognized license plates)
- Detection with at least 95 % accuracy (depending on environmental conditions)
- Camera can be online or offline
- Configuration of the application also via MxManagementCenter (free Advanced Config license required)
- Can be used with all cameras of the MOBOTIX 7 system platform

Smart Data Interface

This app has a Smart Data interface to MxManagementCenter. For information on how to configure, see the corresponding online help of the camera software and MxManagementCenter.

Technical Specifications

Product Information

Product Name	FF Group LPR App – Region EUCA
Order Code	Mx-APP-FF-LPR-EUCA
Supported MOBOTIX Cameras	Mx-M73A, Mx-S74A
Minimum Camera Firmware	V7.0.4.x
MxManagementCenter Integration	min. MxMC v2.3.1

Product Features

App Features	 License plate recognition of one- and two-line license plates Latin and Hebrew characters Recognition log (last 1000 recognized license plates) MOBOTIX events via MxMessageSystem Extended country coverage* White- and blacklisting
Maximum number of lanes	3
Meta Data / Statistic formats	JSON, CSV
Trial License	30-day trial license pre-installed
MxMessageSystem sup- ported	Yes
Interfaces	MxMC Smart Data, IP Notification
MOBOTIX Events	Yes
ONVIF Events	*
Smart Data Interface to MxManagementCenter	Yes

Supported Regions

Europe	Albania, Armenia, Austria, Azerbaijan, Belarus, Belgium, Bosnia and Herzegov- ina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, Iceland, Italy, Ireland, Israel, Kaza- khstan, Kirgizstan, Latvia, Lithuania, Luxembourg, Macedonia, Malta, Moldova, Montenegro, Netherlands, Norway, Poland, Portugal, Romania, Russia, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Tajikistan, Turkey, Turk- menistan, Ukraine, United Kingdom, Uzbekistan, Vatican City State
Israel / Palestine	Israel / Palestine
АРАС	Australia, New Zealand

Scene Requirements

Minimum License Plate Width	130 рх
Maximum Vertical Angle	30°
Maximum Horizontal Angle	30°
Maximum Tilt Angle	5°
MOBOTIX App support	Yes

Technical App Specifications

Synchronous / Asyn- chronous App	Asynchronous
Accuracy	Min. 95% (considering scene requirements)
Processed number of frames per second	Typ. 10 fps
Detection time	Typ. 100 – 120 ms

* available with updates in future

Licensing Certified Apps

The following licenses are available for the FF Group LPR App – Region EUCA:

- 30-day test license pre-installed
- permanent commercial license

The usage period begins with activation of the app (see Activation of the Certified App Interface, p. 26).

Note

For buying or renewing a license pleas contact your MOBOTIX Partner.

Note

Apps are usually pre-installed with the firmware. In rare cases, apps must be downloaded from the website and installed. In this case see **www.mobotix.com** > **Support** > **Download Center** > **Marketing & Documentation**, download and install the app.

Managing Licenses in MxManagementCenter

After a test period commercial licenses must be activated for use with a valid license key. Activation of Certified Apps and events

Online-Activation

After receiving the activation IDs, activate them in MxMC as follows:

- 1. Select from the menu Window > Camera App Licenses.
- 2. Select the camera on which you want to license apps and click **Select**.

Managing Licenses in MxManagementCenter

Fig. 3: Adding licenses

Successful activation

After successful activation, a new log in is required to apply the changes. Alternatively, you can return to license management.

Failed activation (missing internet connection)

If the license server cannot be reached, e.g. due to a missing internet connection, apps can also be activated offline. (see Offline Activation, p. 13).

Offline Activation

For offline activation, the partner/installer from whom you purchased the licenses can generate a capability response (.bin file) on the license server to activate their licenses.

- 1. Select from the menu Window > Camera App Licenses.
- 2. Select the camera on which you want to license apps and click **Select**.

Fig. 8: Overview of the licenses installed on the camera

Note

If necessary, correct the time set on the camera.

Column	Explanation
Name	Name of the licensed app
Expiration	the time limit of the license
Quantity	Number of licenses purchased for a product.
Serial Number	Unique identification determined by MxMC for the device used. If problems occur during licens- ing, please have the device ID ready.

Synchronize licenses with server

When the program starts, there is no automatic comparison of the licenses between the computer and the license server. Therefore, click **Update** to reload the licenses from the server.

Update licenses

To update temporary licenses, click **Activate Licenses**. The dialog for updating/activating licenses opens.

Note

You need administrator rights to synchronize and update licenses.

Camera, image and scene requirements

In order to be able to recognize license plates in the best possible way, the following prerequisites must be fulfilled for the scene:

Quality of the license plate to be captured in the image

- The license plate must be high-contrast and clearly legible, i.e. as clean as possible, without dents or holes and well illuminated.
- The license plate should be rectangular
- Minimum horizontal size
 - 130 px for one-line plates (150 px for license plates from Russia, Kazakhstan, Armenia, Uzbekistan, Serbia)
 - 100 px for two line plates (130 px for license plates from Russia, Kazakhstan, Armenia, Uzbekistan, Serbia)
- Maximum rotation angle: 5°

Maximum tilt angle of the license plate to the camera: 30° horizontal and vertical

Examples of clearly recognizable license plates

Easily readable license plate in daylight

Easily readable license plate at night with infrared LED illumination

Vertical pointing of the camera

The vertical angle to the registration plate must not exceed 30° . The minimum distance (**x**) from the camera as a function of its mounting height (**h**) is calculated by the formula:

 $x = h * \sqrt{3}$

Example: calculation of the vertical alignment of the camera

Horizontal pointing of the camera

The horizontal angle to the registration plate must not exceed 30°. The minimum distance (\mathbf{x}) from the camera as a function of its mounting height (\mathbf{y}) is calculated by the formula:

$$x = y * \sqrt{3}$$

Sample calculation of the horizontal alignment of the camera

Depth of field in relation of vehicle speed and recognition time per

plate

To effectively capture the vehicle camera should be set so as to provide the minimum depth of field (DOF). Depth-of-field (or length of the zone of sharpness) is the distance between the nearest and farthest objects that appear in acceptably sharp focus in a video.

The depth of field can be calculated by the formula:

 $L_{dof} = rac{4*T_{rec}*V_{max}}{3600}$

Definition of the variables use in the formula

 L_{dof} = depth of field in meters (m)

 T_{rec} = recognition time per plate in milliseconds (ms)

 V_{max} =maximum vehicle speed in kilometers per hour (km/h)

Example: calculation of typical cases

maximum vehicle speed in kilometers per hour (km/h)	recognition time per plate in milliseconds (ms)				
	100	200	300	400	500
	depth of	field in me	eters (m)		
40	4	9	13	18	22
80	9	18	27	36	44
100	11	22	33	44	56
120	13	27	40	53	67
140	16	31	47	62	78
180	20	40	60	80	100

maximum vehicle speed in kilometers per hour (km/h)	recognition time per plate in milliseconds (ms)				
	100	200	300	400	500
	depth of	field in me	eters (m)		
200	22	44	67	89	111
220	24	49	73	98	122
240	27	53	80	107	133

Note

The minimum sizes of the license plate on the edges of the zone of sharpness must beat least as mentioned in Quality of the license plate to be captured in the image, p. 18.

Note

For the best possible depth of field it is strongly recommended to manually adjust the cameras aperture settings instead of using the automatic settings.

Exposure time in relation to maximum vehicle speed

The exposure time must be adjusted to get the best results in recognition of license plates. Values are calculated for a camera mounted at a horizontal angle of 30 degrees.

Example: calculation of typical cases

exposure time in seconds (s)	maximum vehicle speed in kilometers per hour (km/h)
1/100	5
1/500	40
1/1000	100
1/2000	200
1/4000	400

Note

The exposure time must be adjusted according to the light conditions.

Recommendations on mounting and adjusting.

- If you want to recognize license plates on multiple lanes it is generally recommended to mount the camera on a crossbar.
- Use an IR Led to recognize license plates at night or under low light conditions.

- Shutter speed must be high enough to cut the light from car's headlights at night (usually it's about 1/1000). Keep in mind, that too high shutter speed may obscure the edges of the lines (especially shadows).
- Depth of focus is a very important parameter. If you are using a camera with a CS-mount lens, use a fixed lens. Fixed lens are better for license plate recognition due to greater depth of focus. Megapixel lens is also strongly recommended.
- Respect changing light conditions (e. g. due to sunrises and sunset) when choosing the place of mounting. Direct sunlight beams can distort a picture. If the cars facing a direct sunlight consider using a lens with auto iris mode.
- If mounting a camera on a roadside pole check how the pole reacts to heavy cars or a convoy of cars.
 Some poles have tangible tremor, this could make license plate recognition almost impossible.
- It is recommended to turn down WDR and BLC. In most cases, they will make the picture more pretty, but at the cost of smudging details like an edges of letters in the license plate. For the same reason keep digital noise reduction as low as possible.
- On certain rare conditions there may be a cases of false detections e. g. because of recognizing image parts that structurally or semantically look similar to a license plate(e. g. fences or ads). To minimize this:
- Adjust the region of interest accordingly. It may be a good idea to make it smaller, or change it's shape, omitting the parts, which potentially may be false detected.
- Adjust the min and max license plate settings according to upper instructions do not leave a default 130 - 300.
- There may be cases, when the best performance will occur by changing angle of lens or moving the camera. In some cases, shooting a front license plate is better.

Troubleshooting

Blurred license plates can not be recognized

Problem: If you need to recognize multiple license plates of cars following one another a wider depth of field might be necessary. In the example below only the license plate in the green frame can be recognized. **Solution**: adjust the lens focus to archive a higher depth of field.

Fig. 11: Insufficient depth of field

Problem: License plate is blurred due to wrong focus settings or to long exposure time. **Solution:** Adjust focus settings or increase shutter speed

Fig. 12: Blurred license plate due to long exposure time

License plates cannot be recognized due to over exposure

Problem: In certain situations license plates can be over exposed and therefore no more readable. Possible cause could be direct sunlight shining on the license plates or to strong IR LED light at night. **Solution:** Adjust shutter speed or dim IR LED light.

Fig. 13: Over exposed license plate at daytime

Camera, image and scene requirements Troubleshooting

Fig. 14: Over exposed license plates due to too strong IR LED light

License plates cannot be recognized due to insufficient light

Problem: In certain situations there is not enough light which results in low contrast. Therefore license plates are not readable. Possible cause could be direct sunlight shining on the license plates or to strong IR LED light at night.

Solution: Adjust the shutter speed or provide extra light.

Fig. 15: Insufficient light to recognize license plate

License plates cannot be recognized due to low resolution

Problem: It seems that the license plate is well recognizable despite good illumination and sufficient resolution.

Solution: Measure the resolution of the license plate to be captured with an image processing program. It may be necessary to adjust the horizontal resolution to the minimum required 130 px (see Camera, image and scene requirements, p. 18).

Fig. 16: Insufficient light to recognize license plate

Activation of the Certified App Interface

Attention

The FF Group LPR App – Region EUCA does not consider obscure areas defined for the live image. Therefore there is no pixelation in obscure areas while configuring the app and during image analysis by the app.

Note

The user must have access to the setup menu (http(s)://<Camera IP address>/control). Therefore check the user rights of the camera.

Activation of Certified Apps and events

 In the camera web interface, open: Setup Menu / Certified App Settings (http(s)://<Camera IP address>/control/app_config).

🏠 🔶 МОВОТ	IX M73 mx10-3	32-6-93 Certified Ap	op Settings

Fig. 17: Certified App: Settings

- 2. Under **General Settings** activate the **Arming** of the app service (see screenshot).
- 3. Under App Settings check the Active option and click Set.
- 4. Click on the name of the App to be configured to open the Apps user interface.
- 5. For configuration of the App see Configuration of FF Group LPR App Region EUCA, p. 27.

Configuration of FF Group LPR App – Region EUCA

Note

For best performance and results in LPR processing make sure to have scene set up to meet the Camera, image and scene requirements, p. 18.

Attention

The user must have access to the setup menu (http(s)://<Camera IP address>/control). Therefore check the user rights of the camera.

- In the camera web interface, open: Setup Menu / Certified App Settings (http(s)://<Camera IP address>/control/app_config).
- 2. Click on the name of the FF Group LPR App Region EUCA.

The configuration window of the app appears with the following options:

Basic settings

🏫 🔶 МОВОТ	IX M73 mx10-3	32-6-96 FF LPF	R Settings		? i

Fig. 18: Default operating mode: Detection

Resolution (1): Select the resolution for the video stream to be analyzed by FF Group LPR App – Region EUCA

Note

The resolution for LPR processing could be different from the resolution used for live stream.

Overlay: Check to enable the display of the license plate recognition result in the live view. **MxMessageEvents:** Check to enable the processing of LPR events in the MxMessageSystem. **Region:** Select the region to be set for the LPR engine. These regions are:

EU+CIS: European and CIS (Commonwealth of Independent States) countries

ISR+PSE: Israel and Palestine

AUS: Australia

NZL: New Zealand

Recognition zones

Up to three recognition zones can be defined. Each detection zone is evaluated by the LPR engine independently of the others. Accordingly, each zone is assigned an individual ID (zone number).

- Recognition Zone	s	
Draw ROI		
ROI	Rectangles Position 182 x 532 Size 260 x 180 Set Rectangle + Sensor Selection Automatic	ROI configuration

Fig. 19: Recognition zones

Drawing a region of interest (ROI)

- 1. In the live view hold the **Shift** key and click the upper left corner point of the region of interest (ROI)
- 2. Release the **Shift** key and click on the lower right corner point of the ROI.
- 3. In the configuration interface click **Set Rectangle** to adopt the coordinates of the rectangle.
- 4. Optionally click the **plus** icon to ads another zone.
- 5. Optionally click the **bin** icon to delete a zone.
- 6. Check Draw ROI to activate the recognition zones.

Note

without activating the zones the full image will be analyzed.

Integration Interfaces

LPR events can be send to 3rd party systems, e. g. Access Control Systems or Video Management Systems. Therefore the following configurations should be taken into account:

✓ Integration Interfaces		
Enable		Enable the integration interface to send IP notifications to a defined external receiver (e.g. 3rd party access control systems, video management system, etc.)
Destination Address	http://server.address	Receiver / Server IP address and port Separate IP address and port using a colon (e.g. 10.0.0.1:80)
Transfer Protocol	HTTP(s) POST 🗸	Transfer notification data using these protocol headers
Device ID	defaultID	Device ID is used as unique identifier for the device sending the IP notification, (e.g. camera's serial number / factory IP address)
Attach Image		Enable to attach an event image to the IP notification
Image Selection	License plate crop 🗸	Selection of the event image to be attached to the IP notification
Event Type: New		Send the IP notification for event type 'new'. Condition 'new' becomes true, if the license plate appears for the first time in 5 seconds
Event Type: Update	D	Send the IP notification for event type 'update'. Condition 'update' becomes true, if the license plate was already detected in the last 5 seconds
Event Type: Lost		Send the IP notification for event type 'lost'. Condition 'lost' becomes true, if plate was not seen in the last 5 seconds since previous detection
self-signed certificates		Allow self-signed certificates for HTTPS

Fig. 20: Integration Interfaces

Enable: Check to enable the integration interface to send IP notifications to a defined external receiver (e.g. 3rd party access control systems, video management system, etc.).

Destination Address: Receiver / Server IP address and port. Separate IP address and port using a colon (e.g. 10.0.0.1:80).

Transfer Protocol: Select the protocol on the basis of which the LPR events are transmitted.

TCP: Data will be transmitted via TCP.

HTTP POST: Data will be transmitted via FFG protocol. Download a detailed description.

Device ID: Set an unique text string to identify your camera device in messages. Device ID is used as unique identifier for the device sending the IP notification (e.g. camera's serial number / factory IP address). **Attach Image:** Check to attach an event image to the IP notification.

Image Selection: If images should be send select the image type here:

License plate crop: The image contains the license plate only.

Vehicle crop: The image contains the vehicle with the recognized license plate.

Full frame: the full image is transmitted.

New: Check to send an IP notification for event type 'new'. Condition 'new' becomes true, if the license plate appears for the first time in 5 seconds.

Update: Check to send an IP notification for event type 'update'. Condition 'update' becomes true, if the license plate was already detected in the last 5 seconds.

Lost: Check to send an IP notification for event type 'lost'. Condition 'lost' becomes true, if plate was not seen in the last 5 seconds since previous detection.

Self signed certificates: Allow self signed certificates for HTTPS.

Black List & White List

You can define a black list and a white list with up to 1000 license plates per list. If a license plate from one of the lists is recognized, a corresponding event is .sent within the MxMessageSystem of the camera.

	LUCY8000	×4		
	KIBMX8080	×		
White List	LUCY6000	×	White list	
white List	FTRC400	×	white list	
	FTSC4168	×		
	$+ \equiv \equiv \equiv \equiv$			
1	123			

Fig. 21: Black and white lists

Adding a license plate to a list

- 1. Click plus (1) and enter the license plate text into the text field
- 2. Click **plus** again to enter another license plate

Adding multiple license plates to a list

1. Click Add multiple license plates (2). A window with a text field appears.

Vhite List	
(IBMX90M	
3VB09	
5BXY100	
(IBMX123	
	/
Set Cancel	//

Fig. 22: Adding multiple license plates

- 2. Enter the text of the license plates to be added one line per license plate.
- 3. Click Set to add the license plates. The editor window closes and the license plates are added to the list.

Deleting a license plate from a list

1. Click Delete license plate (4)

Deleting all license plates from a list

1. Click **Delete all license plates** (3).

Installation Tools

In this section you find useful tools for calibration and trouble shooting.

- Installation T	ools	
Calibration grid		Turn on the calibration grid to detect the acceptable license plate size. Vertical lines indicate a distance of 130 pixels wide. Please keep the license plates in the range 130-300 pixels wide
Debug level	NO LOG 🗸	
LPR Confidence	0,7	Recognition threshold

Fig. 23: Installation Tools

Calibration grid: Check to overlay a 130 px grid (recommended width of the license plate) over the live image. This is useful for checking the correct adjustment of the camera.

Debug level: Select a debug level to generate a log file, which can be helpful e.g. for trouble shooting.

EMERGENCY INFO DEBUG ULTRADEBUG

LPR Confidence: Set a threshold to filter non-plates or poor recognition results.

Attention

Wrong settings can lead to bad recognition results. In most cases the default settings are sufficient.

Storing the Configuration

To store the configuration you have the following options:

- Click on the **Set** button to activate your settings and to save them until the next reboot of the camera.
- Click on the Factory button to load the factory defaults for this dialog (this button may not be present in all dialogs).
- Click on the **Restore** button to undo your most recent changes that have not been stored in the camera permanently.
- Click on the Close button to close the dialog. While closing the dialog, the system checks the entire configuration for changes. If changes are detected, you will be asked if you would like to store the entire configuration permanently.

After successfully saving the configuration, the event and meta data are automatically sent to the camera in case of an event.

About MxMessageSystem

What is MxMessageSystem?

MxMessageSystem is a communication system based on name oriented messages. This means that a message must have a unique name with a maximum length of 32 bytes.

Each participant can send and receive messages. MOBOTIX cameras can also forward messages within the local network. This way, MxMessages can be distributed over the entire local network (see Message Area: Global).

For example, a MOBOTIX 7 series camera can exchange an MxMessage generated by a camera app with an Mx6 camera that does not support certified MOBOTIX apps.

Facts about MxMessages

- 128-bit encryption ensures privacy and security of message content.
- MxMessages can be distributed from any camera of the Mx6 and 7 series.
- The message range can be defined individually for each MxMessage.
 - Local: Camera expects an MxMessage within its own camera system (e.g. through a Certified App).
 - **Global:** the camera expects an MxMessage that is distributed in the local network by another MxMessage device (e.g. another camera of the 7 series equipped with a certified MOBOTIX app).
- Actions that the recipients are to perform are configured individually for each participant of the MxMessageSystem.

Basic configuration: Processing the automatically generated app events

Checking automatically generated app events

Note:

After successfully activating the app (see Activation of the Certified App Interface, p. 26), a generic message event for this specific app is automatically generated in the camera.

- To check the event go to Setup-Menu / Event Control / Event Overview.
- The automatically generated message event profile is named after the application (e. g. FFLPR).

🗠 mx10-32-6-96 Message Events - Profil 1 – Microsoft Edge – 🛛 🛛 🗙			\times

Action handling - Configuration of an action group

Attention

To use events, trigger action groups or record images the general arming of the camera must be enabled (http(s)/<Camera IP address>/control/settings)

An action group defines which action(s) is (are) triggered by the FF Group LPR App – Region EUCA event.

 In the camera web interface, open: Setup Menu / Action Group Overview (http(s)://<Camera IP address>/control/actions).

A CONTRACTION MADE IN THE CONTRACT AND A CONTRACT ANT A CONTRACT ANT A CONTRACT ANT A CONTRACT A			0 0
Name	Arming	Events & Actions	Edit 🄶

FF_Action	Enabled (No time table)	v	Edit
Set	Add ne Restore Close	w group	•

Fig. 25: Defining Action Groups

- Click **Add new group** and give a meaningful name.
- Click **Edit**, to configure the group.

🏫 🔶 МОВОТІХ М73	mx10-32-6-96 Action Group Details	0	i
General Settings	Value	Explanation	*
Action Group	FF_Action	Name: The name is purely informational.	
	Enabled v	Arming: Controls this action group: Enabled: activate the group. Off. deactivate the group. Si: group armed by signal input. CS: group armed by custom signal as defined in <u>General Event Settings</u> .	
	(No time table)	Time Table: Time table for this action profile (<u>Time Tables</u>).	
Event Selection	(Image Analysis: VM2) Message: AIPeople Message: FFLPR Message: VT_Face (Signal: SI)	Event Selection: Select the events which will trigger the actions below. Use [Ctri]-Click to select more than one event. Events in parentheses need to be <u>activated</u> first.	ľ
Action Details	5	Action Deadtime: Time to wait [03600 s] before a new action can take place.	
	Simultaneously	Action Chaining: Choose how the status of each subaction influences the execution of all others. Simultaneously: All actions are executed simultaneously.	Ŧ
Set Fac	ctory Restore Close]	

Fig. 26: Configuring an Action Group

- 1. Activate **Arming** of the Action Group.
- 2. Select your message event in the **Event selection** list. To select multiple events, press the shift key.

3. Click Add new Action

4. Select a proper action from list **Action Type and Profile**.

	IP Notify: HttpRequest Play Sound: StandardSounds Visual Alarm: Red Frame Image Profile: Ultra HD Image Profile: QXGA Image Profile: FullHD		specified order. Consecutively until first success: Consecutive execution, but as scon as one action succeeds, the following actions are not executed. Consecutively until first failure: Consecutive execution, but as scon as one action fails, the following actions are not executed.	
Actions	Image Profile: MEGA		Explanation	
Action 1	Play Sound: StandardS	Sounds 📀	Action Type and Profile: Select the Action Profile to be executed.	
Delete	0		Action Timeout or Duration: If this action runs longer than the time specified [0.3600 s], it is aborted and returns an error; 0 to deactivate. For Image Profile action, this is the duration and no error returns.	
	C	Add new action		

Fig. 27: Select Action Type- and Profile

Note

If the required action profile is not yet available, you can create a new profile in the Admin Menu sections "MxMessageSystem", "Transfer Profiles" and "Audio and VoIP Telephony".

If necessary, you can add further actions by clicking the button again. In this case, please make sure that the "action chaining" is configured correctly (e.g. at the same time).

5. Click on the **Set** button at the end of the dialog box to confirm the settings.

Action settings - Configuration of the camera recordings

1. In the camera web interface, open: **Setup Menu / Event Control / Recording**(http(s)/<Camera IP address>/control/recording).

Storage Settings	Value	Explanation	
Recording (REC)	Event Recording	Recording Mode: Type of event and story recording.	
	Snap Shot Recording	Snap Shot Recording: stores single JPEG pictures. Event Recording: stores stream files for every event	
	Event Recording	using MxPEG codec.	
	Continuous Recording	Continuous Recording: continuously streams video data to stream lies using McPEG codec. Events can be recorded with a higher frame rate using Start Recording, Retrigger Recording and Stop Recording.	
Start Recording	Image Analysis: AS (Image Analysis: VM) (Image Analysis: VM2) Message: AlBiodeep	Start Recording: Select the events which will start recording. Use [Crt/]-Cirk to select more than one event. Events in parentheses need to be <u>activated</u> first.	
	(Signal: SI) Signal: LIC		
	Max fps ᅌ	Event Frame Rate: Recording speed if an event is detected, in frames per second.	
	0	Recording Time Before Event: Additional recording time before an event in seconds.	
	30 s 😳	Recording Time: Time to include in recorded stream after an event has occurred.	

Fig. 28: Configuration of camera recording settings

- 2. Activate Arm Recording.
- 3. Under **Storage Settings** / **Recording (REC)** select a **Recording mode**. The following modes are available:
 - Snap Shot Recording
 - Event Recording

- Continuous Recording
- 4. In list **Start recording** select the message event just created.
- 5. Click on the **Set** button at the end of the dialog box to confirm the settings.
- 6. Click on **Close** to save your settings permanently.

Note

Alternatively, you can save your settings in the Admin menu under Configuration / Save current configuration to permanent memory.

Advanced Configuration: Processing the meta data transmitted by apps

Meta data transferred within the MxMessageSystem

For each event, the app also transfers meta data to the camera. This data is sent in the form of a JSON schema within an MxMessage.

} +	}

Fig. 29: Example: Meta data transmitted within an MxMessage of the FF Group LPR App - Region EUCA

Note:

To view the meta data structure of the last App event, enter the following URL in the address bar of your browser: http(s)/IPAddresseOfYourCamera/api/json/messages

Creating a Custom Message Event

 In the camera web interface, open: Setup Menu / Event Control / Event Overview (http(s)://<Camera IP address>/control/event_msg)

FFLPR		☐ Inactive ☐ Delete
	5 3	Event Dead Time: Time to wait [03600 s] before the event can trigger anew.
Event Sensor Type	 IP Receive MxMessageSystem 	Event Sensor Type: Choose the message sensor.
	Event on receiving a message from the Ma	xMessageSystem.
	FFLPR.custom.blacklist	Message Name: Defines an MxMessageSystem name to wait for.
	Local	Message Range: There are two different ranges of message distribution: <i>Global:</i> across all cameras within the current LAN. <i>Local:</i> camera internal.
	JSON Comparison	Filter Message Content: Optionally choose how to ignore messages containing <i>Filter Value</i> . Select <i>No Filter</i> to trigger on any message with defined <i>Message Name</i> .
	"true"	Filter Value: Define either a valid reference value as a string (in JSON format) without line breaks, or an extended regular expression. Open help for examples. This parameter allows using <u>variables</u> .

Fig. 30: Example configuration of an user-defined "blacklist" event

- 2. Configure the parameters of the event profile as follows:
 - Profile Name: Enter an event related / application related profile name that illustrates the purpose of the profile.
 - Message Name: Enter the "Message Name" according to the event documentation of the corresponding app (see table Examples for message names and filter values of the FF Group LPR App Region EUCA, p. 39 below)
 - Message Range:
 - Local: Default settings for the FF Group LPR App Region EUCA
 - Global: (MxMessage is forwarded from another MOBOTIX camera in the local network.
 - Filter Message Content:
 - Generic Event: "No Filter"
 - Filtered Event: "JSON Equal Compare"

Filter Value: see table Examples for message names and filter values of the FF Group LPR App – Region EUCA, p. 39.

Note

"Filter Value" is used to differentiate the MxMessages of an app / bundle. Use this entry to benefit from individual event types of the apps (if available).

Choose "No Filter" if you want to use all incoming MxMessages as generic event of the related app.

2. Click on the **Set** button at the end of the dialog box to confirm the settings.

Examples for message names and filter values of the FF Group LPR App – Region EUCA

FF Group LPR App - Region EUCA	MxMessage Name	Filter Value
Generic Event	FFLPR	"recognizedPersons"
Whitelist Event	FFLPR.custom.whitelist	"true"
Blacklist Event Not listed Event	FFLPR.custom.blacklist	"true"
Not listed Event	FFLPR.custom.notlisted	"true"
Unique license plate event	FFLPR.plate.LicensePlate	License plate code as "STRING"; e.g. "LUCY8000" (comp. Meta data transferred within the MxMessageSystem, p. 37)
Incoming Vehicle Event	FFLPR.plate.Direction	"in"
Outgoing Vehicle Event	FFLPR.plate.Direction	"out"
