Support

MOBOTIX Support

If you need technical support, please contact your MOBOTIX dealer. If your dealer cannot help you, he will contact the support channel to get an answer for you as quickly as possible.

If you have internet access, you can open the MOBOTIX help desk to find additional information and software updates.

Please visit www.mobotix.com > **Support** > **Help Desk**.

MOBOTIX eCampus

The MOBOTIX eCampus is a complete e-learning platform. It lets you decide when and where you want to view and process your training seminar content. Simply open the site in your browser and select the desired training seminar.

Please visit www.mobotix.com/ecampus-mobotix.

MOBOTIX Community

The MOBOTIX community is another valuable source of information. MOBOTIX staff and other users are sharing their information, and so can you.

Please visit community.mobotix.com.

Safety Notes

- This camera must be installed by qualified personnel and the installation should conform to all local codes.

- This product must not be used in locations exposed to the dangers of explosion.
- Do not use this product in a dusty environment.
- Protect this product from moisture or water entering the housing.
- Install this product as outlined in this document. A faulty installation can damage the product!
- Do not replace batteries of the camera. If a battery is replaced by an incorrect type, the battery can explode.
- External power supplies must comply with the Limited Power Source (LPS) requirements and share the same power specifications with the camera.
- When using a Class I adapter, the power cord shall be connected to a socket-outlet with proper ground connection.
- To comply with the requirements of EN 50130-4 regarding the power supply of alarm systems for 24/7 operation, it is highly recommended to use an uninterruptible power supply (UPS) for backing up the power supply of this product.

Legal Notes

Legal Aspects of Video and Sound Recording

You must comply with all data protection regulations for video and sound monitoring when using MOBOTIX AG products. Depending on national laws and the installation location of the cameras, the recording of video and sound data may be subject to special documentation or it may be prohibited. All users of MOBOTIX products are therefore required to familiarize themselves with all applicable regulations and to comply with these laws. MOBOTIX AG is not liable for any illegal use of its products.

Declaration of Conformity

The products of MOBOTIX AG are certified according to the applicable regulations of the EC and other countries. You can find the declarations of conformity for the products of MOBOTIX AG on www.mobotix.com under **Support > Download Center > Marketing & Documentation > Certificates & Declarations of Conformity**.

RoHS Declaration

The products of MOBOTIX AG are in full compliance with European Unions Restrictions of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment (RoHS Directive 2011/65/EC) as far as they are subject to these regulations (for the RoHS Declaration of MOBOTIX, please see www.mobotix.com, **Support > Download Center > Marketing & Documentation > Brochures & Guides > Certificates**).

Disposal

Electrical and electronic products contain many valuable materials. For this reason, we recommend that you dispose of MOBOTIX products at the end of their service life in accordance with all legal requirements and regulations (or deposit these products at a municipal collection center). MOBOTIX products must not be disposed of in household waste! If the product contains a battery, please dispose of the battery separately (the corresponding product manuals contain specific directions if the product contains a battery).

Disclaimer

MOBOTIX AG does not assume any responsibility for damages, which are the result of improper use or failure to comply to the manuals or the applicable rules and regulations. Our General Terms and Conditions apply. You can download the current version of the **General Terms and Conditions** from our website at www.mobotix.com by clicking on the corresponding link at the bottom of every page.

It is the User's responsibility to comply with all applicable local, state, national and foreign laws, rules, treaties and regulations in connection with the use of the Software and Product, including those related to data privacy, the Health Insurance Portability and Accountability Act of 1996 (HIPPA), international communications and the transmission of technical or personal data.

About FF Group License Plate Recognition App - Region Americas

Certified App for License Plate Recognition

The application recognizes with at least 95% hit probability single and double line license plates from the USA with Latin characters. The high-performance app is capable of monitoring up to three lanes. Depending on the amount of lanes, the application is suitable for vehicles with up to 200 km/h. Via granted & denied, any follow-up actions can be triggered when a recognized license plate belongs to a list (e.g. notification to security service). Typical application areas for the app are: Parking management, access control and regulation, traffic monitoring.

- App delivers events via MxMessageSystem in real-time
- Integrated recognition protocol (last 1000 recognized license plates)
- Detection with at least 95 % accuracy
- Camera can be online or offline
- Configuration of the application also via MxManagementCenter (free Advanced Config license required)
- Usable with all cameras of the MOBOTIX 7 system platform

CAUTION! Thermal sensors are not supported by this app.

Smart Data Interface to MxManagementCenter

This app has a Smart Data interface to MxManagementCenter.

With the MOBOTIX Smart Data System, transaction data can be linked to the video recordings made at the time of the transactions. Smart Data source can be e.g. MOBOTIX Certified Apps (no license required) or general Smart Data sources (license required) like POS systems or license plate recognition systems.

The Smart Data System in MxManagementCenter enables you to quickly find and review any suspicious activities. The Smart Data Bar and the Smart Data View are available for searching and analyzing transactions. The Smart Data Bar provides a direct overview of the most recent transactions (from the last 24 hours) and for this reason it is convenient to use it for reviews and searches.

NOTE! For information on how to use the Smart Data System, see the corresponding online help of the camera software and MxManagementCenter.

Technical Specifications

Product Information

Product Name	FF Group License Plate Recognition App - Region Americas
Order Code	Mx-APP-FF-LPR-AM
Supported MOBOTIX Cameras	Mx-M73A, Mx-S74A
Minimum Camera Firmware	v7.1.2.24
MxManagementCenter Integration	- min. MxMC v2.4.x - Configuration: Advanced Config license required - Event Search: Smart Data Interface license included

Product Features

App Features	<ul style="list-style-type: none">■ License plate recognition of one- and two-line license plates■ Recognition of latin characters optimized for American license plates■ Recognition log (Smart Data / Event Search via MxManagementCenter)■ MOBOTIX events via MxMessageSystem■ Multiple lists for individual actions (e.g. access granted, alarm, etc.)
Maximum number of lanes	3
Maximum number of enrolled license plates	1000
Meta Data / Statistic formats	JSON
Trial License	30-day trial license pre-installed
MxMessageSystem supported	Yes
Integration interfaces	- 3rd party integration via HTTP(S) Post and TCP messages - compare supported camera interfaces
MOBOTIX Events	Yes
ONVIF Events	Yes (Generic message event)

Supported Regions

Supported license plates / countries	see https://community.mobotix.com/t/ff-group-lpr-app-region-america-supported-license-plates-countries/3293

Accuracy	min. 95% (considering scene requirements)
----------	---

Processed framerate	typ. 10 fps
---------------------	-------------

Detection time	typ. 80ms (one lane) typ. 120ms (two lanes)
----------------	--

Licensing Certified Apps

The following licenses are available for the FF Group License Plate Recognition App - Region Americas:

- **30-day test license** pre-installed
- **permanent commercial license**

The usage period begins with activation of the app interface (see [Activation of the Certified App Interface](#), p. 29)

NOTE! For buying or renewing a license, contact your MOBOTIX Partner.

NOTE! Apps are usually pre-installed with the firmware. In rare cases, apps must be downloaded from the website and installed. In this case see www.mobotix.com > **Support** > **Download Center** > **Marketing & Documentation**, download and install the app.

License Activation of Certified Apps in MxManagementCenter

After a test period commercial licenses must be activated for use with a valid license key.

Online-Activation

After receiving the activation IDs, activate them in MxMC as follows:

1. Select from the menu **Window > Camera App Licenses**.
2. Select the camera on which you want to license apps and click **Select**.

Name	Url	Serial Number
mx10-10-38-40	10.10.38.40	10.10.38.40
mx10-22-10-30	10.22.10.30	10.22.10.30
M73 10-32-0-62	10.32.0.62	10.32.0.62

Fig. 1: Overview of Camera App Licenses in MxManagementCenter

NOTE! If necessary, correct the time set on the camera.

1. An overview of the licenses installed on the camera may be displayed. Click **Activate License**.

Name	Expiration	Quantity
MxWheelDetector	Permanent	Unlimited
iot_plugin_a	Permanent	Unlimited
iot_plugin_b	Permanent	Unlimited
iot_plugin_c	Permanent	Unlimited
iot_plugin_d	Permanent	Unlimited
iot_plugin_e	Permanent	Unlimited
iot_plugin_f	Permanent	Unlimited
iot_plugin_g	Permanent	Unlimited
iot_plugin_h	Permanent	Unlimited
iot_plugin_i	Permanent	Unlimited
iot_plugin_j	Permanent	Unlimited

Fig. 2: Overview of the licenses installed on the camera

NOTE! If necessary, correct the time set on the camera.

2. Enter a valid Activation ID and specify the number of licenses to install on this computer.
3. If you want to license another product, click on . In the new row, enter the appropriate Activation ID and the number of licenses you want.

Licensing Certified Apps

License Activation of Certified Apps in MxManagementCenter

4. To remove a line click .
5. When you have entered all Activation IDs, click **Activate License Online**. During activation, **MxMC** connects to the license server. This requires an Internet connection.

Fig. 3: Adding licenses

Successful activation

After successful activation, a new log in is required to apply the changes. Alternatively, you can return to license management.

Failed activation (missing internet connection)

If the license server cannot be reached, e.g. due to a missing internet connection, apps can also be activated offline. (see [Offline Activation](#), p. 14).

Offline Activation

For offline activation, the partner/installer from whom you purchased the licenses can generate a capability response (.bin file) on the license server to activate their licenses.

1. Select from the menu **Window > Camera App Licenses**.
2. Select the camera on which you want to license apps and click **Select**.

Fig. 4: Overview of Camera App Licenses in MxManagementCenter

NOTE! If necessary, correct the time set on the camera.

3. An overview of the licenses installed on the camera may be displayed. Click **Activate License**.

Fig. 5: Overview of the licenses installed on the camera

NOTE! If necessary, correct the time set on the camera.

Licensing Certified Apps

License Activation of Certified Apps in MxManagementCenter

4. Enter a valid Activation ID and specify the number of licenses to install on this computer.
5. If you want to license another product, click on . In the new row, enter the appropriate **Activation ID** and the number of licenses you want.
6. If necessary, click  to remove a line.
7. When you have entered all Activation IDs, click **Download Capability Request File (.lic)** and send it to your partner/installer.

NOTE! This file allows the partner / installer from whom you purchased the licenses to generate a capability response file (.bin) on the license server.

Fig. 6: Adding licenses

8. Click Load Capability Response File and follow the instructions.

Successful activation

After successful activation, a new log in is required to apply the changes. Alternatively, you can return to license management.

Managing Licenses in MxManagementCenter

In MxManagementCenter you can comfortably manage all licenses that have been activated for a camera.

1. Select from the menu **Window > Camera App Licenses**.
2. Select the camera on which you want to license apps and click **Select**.

Fig. 7: Overview of Camera App Licenses in MxManagementCenter

An overview of the licenses installed on the camera may be displayed.

Fig. 8: Overview of the licenses installed on the camera

NOTE! If necessary, correct the time set on the camera.

Column	Explanation
Name	Name of the licensed app
Expiration	the time limit of the license
Quantity	Number of licenses purchased for a product.
Serial Number	Unique identification determined by MxMC for the device used. If problems occur during licensing, please have the device ID ready.

Synchronize licenses with server

When the program starts, there is no automatic comparison of the licenses between the computer and the license server. Therefore, click **Update** to reload the licenses from the server.

Update licenses

To update temporary licenses, click **Activate Licenses**. The dialog for updating/activating licenses opens.

NOTE! You need administrator rights to synchronize and update licenses.

Camera, image and scene requirements

In order to be able to recognize license plates in the best possible way, the following prerequisites must be fulfilled for the scene:

Quality of the license plate to be captured in the image

- The license plate must be high-contrast and clearly legible, i.e. as clean as possible, without dents or holes and well illuminated.
- The license plate should be rectangular
- Minimum horizontal size
 - 130 px for one-line plates (150 px for license plates from Russia, Kazakhstan, Armenia, Uzbekistan, Serbia)
 - 100 px for two line plates (130 px for license plates from Russia, Kazakhstan, Armenia, Uzbekistan, Serbia)
- Maximum rotation angle: 5°

- Maximum tilt angle of the license plate to the camera: 30° horizontal and vertical

Examples of clearly recognizable license plates

Easily readable license plate in daylight

Easily readable license plate at night with infrared LED illumination

Vertical pointing of the camera

The vertical angle to the registration plate must not exceed 30°. The minimum distance (x) from the camera as a function of its mounting height (h) is calculated by the formula:

$x = h * \sqrt{3}$

Example: calculation of the vertical alignment of the camera

h (Meter)	x (Meter)
1	1,7
1,5	2,6
2	3,4
2,5	4,3
3	5,1
3,5	6
4	6,8

Fig. 9: Vertical pointing of the camera

Horizontal pointing of the camera

The horizontal angle to the registration plate must not exceed 30°. The minimum distance (x) from the camera as a function of its mounting height (y) is calculated by the formula:

$x = y * \sqrt{3}$

Sample calculation of the horizontal alignment of the camera

y (meter)	x (meter)
1	1,7
1,5	2,6

Fig. 10: Horizontal alignment of the camera

y (meter)	x (meter)
2	3,4
2,5	4,3
3	5,1
3,5	6
4	6,8

Fig. 10: Horizontal alignment of the camera

Depth of field in relation of vehicle speed and recognition time per plate

To effectively capture the vehicle camera should be set so as to provide the minimum depth of field (DOF). Depth-of-field (or length of the zone of sharpness) is the distance between the nearest and farthest objects that appear in acceptably sharp focus in a video.

The depth of field can be calculated by the formula:

$$L_{dof} = \frac{4 * T_{rec} * V_{max}}{3600}$$

Definition of the variables use in the formula

L_{dof} = depth of field in meters (m)

T_{rec} = recognition time per plate in milliseconds (ms)

V_{max} =maximum vehicle speed in kilometers per hour (km/h)

Example: calculation of typical cases

maximum vehicle speed in kilometers per hour (km/h)	recognition time per plate in milliseconds (ms)				
	100	200	300	400	500
	depth of field in meters (m)				
40	4	9	13	18	22
80	9	18	27	36	44
100	11	22	33	44	56
120	13	27	40	53	67
140	16	31	47	62	78
180	20	40	60	80	100
200	22	44	67	89	111
220	24	49	73	98	122
240	27	53	80	107	133

NOTE! The minimum sizes of the license plate on the edges of the zone of sharpness must be at least as mentioned in [Quality of the license plate to be captured in the image, p. 19](#).

NOTE! For the best possible depth of field it is strongly recommended to manually adjust the camera's aperture settings instead of using the automatic settings.

Exposure time in relation to maximum vehicle speed

The exposure time must be adjusted to get the best results in recognition of license plates. Values are calculated for a camera mounted at a horizontal angle of 30 degrees.

Example: calculation of typical cases

exposure time in seconds (s)	maximum vehicle speed in kilometers per hour (km/h)
1/100	5
1/500	40
1/1000	100
1/2000	200
1/4000	400

NOTE! The exposure time must be adjusted according to the light conditions.

Recommendations on mounting and adjusting.

- If you want to recognize license plates on multiple lanes it is generally recommended to mount the camera on a crossbar.
- Use an IR Led to recognize license plates at night or under low light conditions.
- Shutter speed must be high enough to cut the light from car's headlights at night (usually it's about 1/1000). Keep in mind, that too high shutter speed may obscure the edges of the lines (especially shadows).
- Depth of focus is a very important parameter. If you are using a camera with a CS-mount lens, use a fixed lens. Fixed lens are better for license plate recognition due to greater depth of focus. Megapixel lens is also strongly recommended.
- Respect changing light conditions (e. g. due to sunrises and sunset) when choosing the place of mounting. Direct sunlight beams can distort a picture. If the cars facing a direct sunlight consider using a lens with auto iris mode.

- If mounting a camera on a roadside pole check how the pole reacts to heavy cars or a convoy of cars. Some poles have tangible tremor, this could make license plate recognition almost impossible.
- It is recommended to turn down WDR and BLC. In most cases, they will make the picture more pretty, but at the cost of smudging details like an edges of letters in the license plate. For the same reason keep digital noise reduction as low as possible.
- On certain rare conditions there may be a cases of false detections e. g. because of recognizing image parts that structurally or semantically look similar to a license plate(e. g. fences or ads). To minimize this:
 - Adjust the region of interest accordingly. It may be a good idea to make it smaller, or change it's shape, omitting the parts, which potentially may be false detected.
 - Adjust the min and max license plate settings according to upper instructions do not leave a default 130 - 300.
- There may be cases, when the best performance will occur by changing angle of lens or moving the camera. In some cases, shooting a front license plate is better.

Troubleshooting

Blurred license plates can not be recognized

Problem: If you need to recognize multiple license plates of cars following one another a wider depth of field might be necessary. In the example below only the license plate in the green frame can be recognized.

Solution: adjust the lens focus to archive a higher depth of field.

Fig. 11: Insufficient depth of field

Problem: License plate is blurred due to wrong focus settings or to long exposure time.

Solution: Adjust focus settings or increase shutter speed

Fig. 12: Blurred license plate due to long exposure time

License plates cannot be recognized due to over exposure

Problem: In certain situations license plates can be over exposed and therefore no more readable. Possible cause could be direct sunlight shining on the license plates or to strong IR LED light at night.

Solution: Adjust shutter speed or dim IR LED light.

Fig. 13: Over exposed license plate at daytime

Fig. 14: Over exposed license plates due to too strong IR LED light

License plates cannot be recognized due to insufficient light

Problem: In certain situations there is not enough light which results in low contrast. Therefore license plates are not readable. Possible cause could be direct sunlight shining on the license plates or too strong IR LED light at night.

Solution: Adjust the shutter speed or provide extra light.

Fig. 15: Insufficient light to recognize license plate

License plates cannot be recognized due to low resolution

Problem: It seems that the license plate is well recognizable despite good illumination and sufficient resolution.

Solution: Measure the resolution of the license plate to be captured with an image processing program. It may be necessary to adjust the horizontal resolution to the minimum required 130 px (see [Camera, image and scene requirements](#), p. 19).

Fig. 16: Insufficient light to recognize license plate

Activation of the Certified App Interface

CAUTION! The FF Group License Plate Recognition App - Region Americas does not consider obscure areas defined for the live image. Therefore there is no pixelation in obscure areas while configuring the app and during image analysis by the app.

NOTE! The user must have access to the setup menu ([http\(s\)://<camera IP address>/control](http(s)://<camera IP address>/control)). Therefore check the user rights of the camera.

1. In the camera web interface, open: **Setup Menu / Certified App Settings** ([http\(s\)://<camera IP address>/control/app_config](http(s)://<camera IP address>/control/app_config)).

Drawing a Recognition Area

1. Click the **plus** icon ① to switch into the live image.
2. In the live view simply click and drag a rectangular recognition area.
3. Drag the corner points to refine the recognition area.
4. In the top right corner of the live view click **Submit** to adopt the coordinates of the rectangle.
5. Optionally click the **bin** icon ② to delete the recognition area.

NOTE! Without activating the zones the full image will be analyzed.

Integration Interfaces

LPR events can be send to 3rd party systems, e. g. Access Control Systems or Video Management Systems. Therefore the following configurations should be taken into account:

Integration Interfaces		
Enable	<input type="checkbox"/>	Enable the integration interface to send IP notifications to a defined external receiver (e.g. 3rd party access control systems, video management system, etc.)
Destination Address	<input type="text" value="http://server.address"/>	Receiver / Server IP address and port. Separate IP address and port using a colon (e.g. 10.0.0.1:80)
Transfer Protocol	<input type="text" value="HTTP(s) POST"/>	Transfer notification data using these protocol headers
Device ID	<input type="text" value="defaultID"/>	Device ID is used as unique identifier for the device sending the IP notification (e.g. camera's serial number / factory IP address)
Attach Image	<input type="checkbox"/>	Enable to attach an event image to the IP notification
Image Selection	<input type="text" value="License plate crop"/>	Selection of the event image to be attached to the IP notification
Event Type: New	<input type="checkbox"/>	Send the IP notification for event type 'new'. Condition 'new' becomes true, if the license plate appears for the first time in 5 seconds
Event Type: Update	<input type="checkbox"/>	Send the IP notification for event type 'update'. Condition 'update' becomes true, if the license plate was already detected in the last 5 seconds
Event Type: Lost	<input type="checkbox"/>	Send the IP notification for event type 'lost'. Condition 'lost' becomes true, if plate was not seen in the last 5 seconds since previous detection
self-signed certificates	<input type="checkbox"/>	Allow self-signed certificates for HTTPS

Enable: Check to enable the integration interface to send IP notifications to a defined external receiver (e.g. 3rd party access control systems, video management system, etc.).

Destination Address: Receiver / Server IP address and port. Separate IP address and port using a colon (e.g. 10.0.0.1:80).

Transfer Protocol: Select the protocol on the basis of which the LPR events are transmitted.

TCP: Data will be transmitted via TCP.

HTTP POST: Data will be transmitted via FFG protocol. [Download a detailed description.](#)

Device ID: Set an unique text string to identify your camera device in messages. Device ID is used as unique identifier for the device sending the IP notification (e.g. camera's serial number / factory IP address).

Attach Image: Check to attach an event image to the IP notification.

Image Selection: If images should be send select the image type here:

License plate crop: The image contains the license plate only.

Vehicle crop: The image contains the vehicle with the recognized license plate.

Full frame: the full image is transmitted.

Event Type: New: Check to send an IP notification for event type 'new'. Condition 'new' becomes true, if the license plate appears for the first time in 5 seconds.

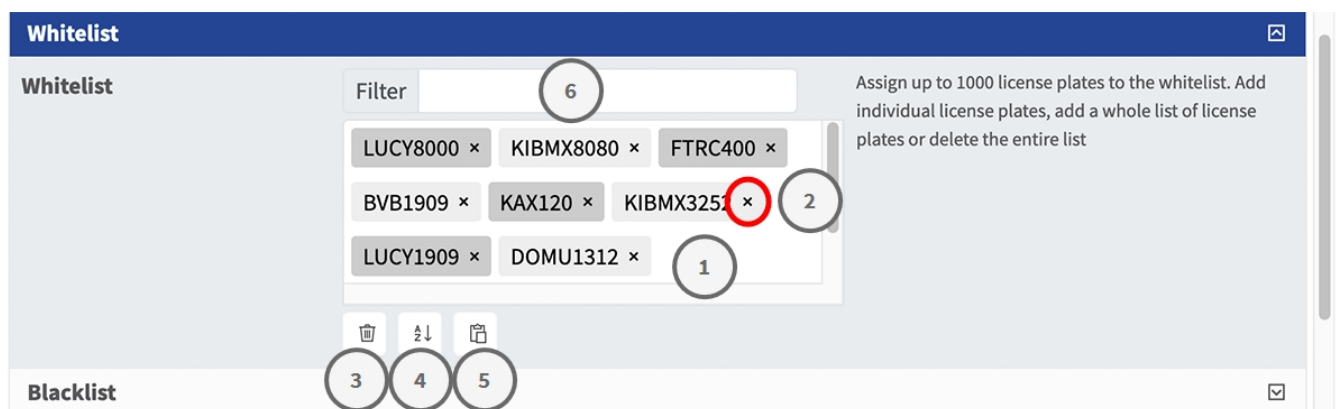

Event Type: Update: Check to send an IP notification for event type 'update'. Condition 'update' becomes true, if the license plate was already detected in the last 5 seconds.

Event Type: Lost: Check to send an IP notification for event type 'lost'. Condition 'lost' becomes true, if plate was not seen in the last 5 seconds since previous detection.

Self signed certificates: Allow self signed certificates for HTTPS.

Black List & White List

You can define a black list and a white list with up to 1000 license plates per list. If a license plate from one of the lists is recognized, a corresponding event is sent within the MxMessageSystem of the camera.

Adding a license plate to a list

- Enter the license plate text into the text field ① and click **Enter**.

Adding multiple license plates from a text file

1. Make sure that your text file contains one license plate per line.
2. Copy the relevant license plates from the text file and paste them into the text field① .

Deleting a license plate from a list

- Click on the small x ② to the right of the license plate number.

Deleting all license plates from a list

- Click the trash icon ③ .

Sorting all license plates from a list alphabetically

- Click the sort icon ④ .

Copy all license plates from a list to the clip board

- Click the copy to clipboard icon ⑤ .

Filtering license plates

- Enter the license plate or parts of it into the filter text field⑥ . Only license plates containing the filter text are displayed accordingly

Installation Tools

In this section you find useful tools for calibration and trouble shooting.

Installation Tools		
Calibration grid	<input type="checkbox"/>	Turn on the calibration grid to detect the acceptable license plate size. Vertical lines indicate a distance of 130 pixels wide. Please keep the license plates in the range 130-300 pixels wide
Debug level	<div> <div>✓ NO LOG</div> <div>DEBUG</div> </div>	Available options NO LOG: No debug log is created (Factory default). DEBUG: Added additional info to overlay text
LPR Confidence	0.7	Set the confidence threshold which must be reached to recognize license plates. The confidence value within the sent MxMessage can be used as an indication for a proper configuration.
Minimum license plate characters	6	Defines the minimum number of characters in the recognized license plates, shorter sequences will be ignored. The practical recommended minimum is 5. Default 6.
Maximum license plate characters	10	Defines the maximum number of characters in the recognized license plates, longer sequences will be ignored. Default 10.
The Levenshtein distance is a string metric for measuring the difference between two sequences.	1	The Levenshtein distance between two words is the minimum number of single-character edits (insertions, deletions or substitutions) required to change one word into the other.

Calibration grid: Turn on the calibration grid to detect the acceptable license plate size. Vertical lines indicate a distance of 130 pixels wide. Please keep the license plates in the range 130-300 pixels wide.

Color Confidence: Set the confidence threshold which must be reached to recognize color of the vehicle. The confidence value within the sent MxMessage can be used as an indication for a proper configuration.

Debug level: Select a debug level to generate a log file, which can be helpful e.g. for trouble shooting.

NOLOG: no debug log is created (default setting)

EMERGENCY

INFO

DEBUG

ULTRADEBUG

LPR Confidence: Set the confidence threshold which must be reached to recognize license plates. The confidence value within the sent MxMessage can be used as an indication for a proper configuration.

CAUTION! Wrong settings can lead to bad recognition results. In most cases the default settings are sufficient.

Storing the Configuration

To store the configuration you have the following options:

- Click **Set** to activate your settings and to save them until the next reboot of the camera.
- Click **Factory** to load the factory defaults for this dialog (this button may not be present in all dialogs).
- Click **Restore** to undo your most recent changes that have not been stored in the camera permanently.
- Click **Close** to close the dialog. While closing the dialog, the system checks the entire configuration for changes. If changes are detected, you will be asked if you would like to store the entire configuration permanently.

After successfully saving the configuration, the event and meta data are automatically sent to the camera in case of an event.

MxMessageSystem

What is MxMessageSystem?

MxMessageSystem is a communication system based on name oriented messages. This means that a message must have a unique name with a maximum length of 32 bytes.

Each participant can send and receive messages. MOBOTIX cameras can also forward messages within the local network. This way, MxMessages can be distributed over the entire local network (see Message Area: Global).

For example, a MOBOTIX 7 series camera can exchange a MxMessage generated by a camera app with an Mx6 camera that does not support certified MOBOTIX apps.

Facts about MxMessages

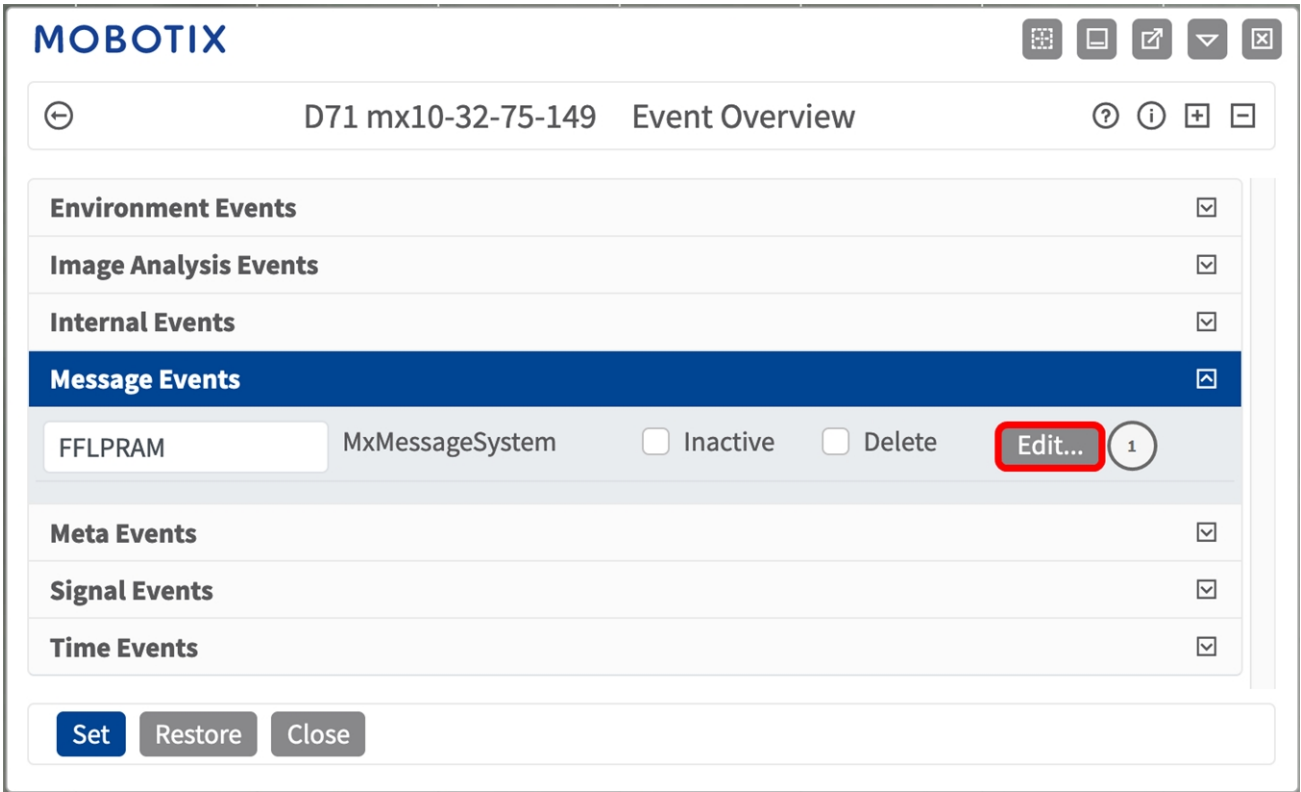

- 128-bit encryption ensures privacy and security of message content.
- MxMessages can be distributed from any camera of the Mx6 and 7 series.
- The message range can be defined individually for each MxMessage.
 - **Local:** Camera expects a MxMessage within its own camera system (e.g. through a Certified App).
 - **Global:** the camera expects a MxMessage that is distributed in the local network by another MxMessage device (e.g. another camera of the 7 series equipped with a certified MOBOTIX app).
- Actions that the recipients are to perform are configured individually for each participant of the MxMessageSystem.

MxMessageSystem: Processing the automatically generated app events

Checking automatically generated app events

NOTE! After successfully activating the app (see [Activation of the Certified App Interface, p. 29](#)), a generic message event for this specific app is automatically generated in the camera.

1. Go to **Setup-Menu / Event Control / Event Overview**. In section **Message Events** the automatically generated message event profile is named after the application (e. g. FFLPRAM).

2. Click **Edit**① to display and configure the event properties in detail.

Action handling - Configuration of an Action Group

CAUTION! To use events, trigger Action Groups or record images the general arming of the camera must be enabled ([http\(s\)/<camera IP address>/control/settings](http(s)/<camera IP address>/control/settings))

An Action Group defines which action(s) is (are) triggered by the FF Group License Plate Recognition App - Region Americas event.

1. In the camera web interface, open: **Setup Menu / Action Group Overview** ([http\(s\)://<camera IP address>/control/actions](http(s)://<camera IP address>/control/actions)).

2. Click **Add new group**① and give a meaningful name.
3. Click **Edit**② , to configure the group.

6. Click on **Close**⑤ to save your settings permanently.

NOTE! Alternatively, you can save your settings in the Admin menu under Configuration / Save current configuration to permanent memory.

Checking Automatically Generated App Events

NOTE! After successfully activating the app (see [Activation of the Certified App Interface, p. 29](#)), a generic message event for this specific app is automatically generated in the camera.

1. Go to **Setup-Menu / Event Control / Event Overview**. In section **Message Events** the automatically generated message event profile is named after the application (e. g. FFLPRAM).

The screenshot displays the MOBOTIX Event Overview interface. At the top, the MOBOTIX logo is on the left, and a series of icons (grid, window, expand, dropdown, close) are on the right. Below the logo, a header bar shows a back arrow, the text 'D71 mx10-32-75-149 Event Overview', and a help icon, information icon, and expand/collapse icons. The main content area is a list of event categories, each with a checkbox on the right: Environment Events, Image Analysis Events, Internal Events, Message Events (highlighted in blue), Meta Events, Signal Events, and Time Events. Below the Message Events section, there is a table with one row. The first column contains a text input field with 'FFLPRAM'. The second column contains the text 'MxMessageSystem'. The third column has an 'Inactive' checkbox. The fourth column has a 'Delete' checkbox. The fifth column has an 'Edit...' button, which is highlighted with a red rectangle. To the right of the 'Edit...' button is a circular badge with the number '1'. At the bottom of the interface, there are three buttons: 'Set', 'Restore', and 'Close'.

Event Category	Checkbox
Environment Events	<input checked="" type="checkbox"/>
Image Analysis Events	<input checked="" type="checkbox"/>
Internal Events	<input checked="" type="checkbox"/>
